

Changed your graphics card?

Rebuild the analysis model

During setup, SwingEZ builds an **analysis model optimized for your PC's graphics card**. If the graphics card is replaced, that model no longer matches the new card — **the game still launches normally, but shot analysis fails**. Rebuilding the model once, as described below, resolves this.

Applies to PCs with a replaced graphics card **Time required** about 15–30 minutes (one time)

Where Launcher Settings → Maintenance

SYMPTOMS

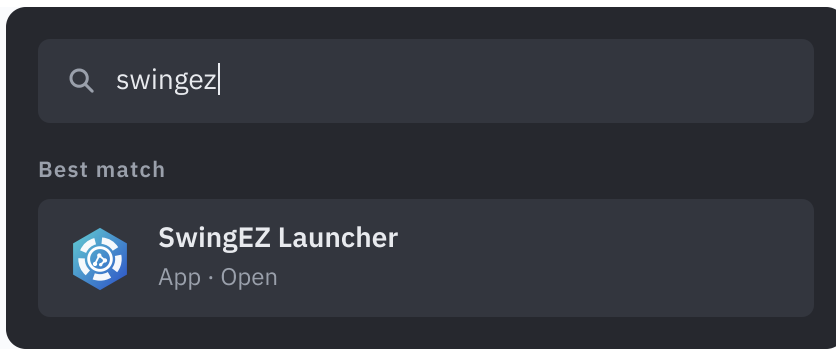

If, after changing the graphics card, **the game starts but your shots are not analyzed**, this is the cause. A game that launches is not necessarily healthy — after a graphics card change, **the model must be rebuilt**.

Before the change	After the change	After the rebuild
Model built for the old card	Model mismatch → analysis fails	Analysis works

STEP 1 Launch SwingEZ Launcher manually

Normally the launcher opens automatically and closes itself when the game starts, so this time you need to **open the launcher yourself**.

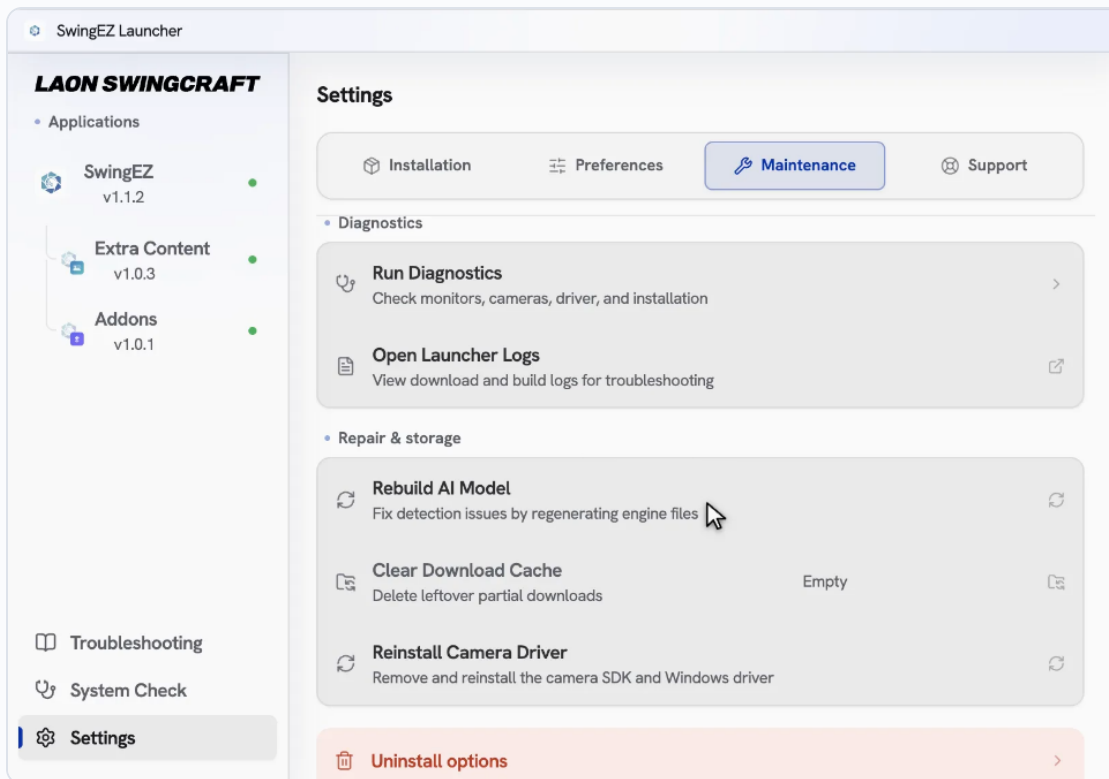

Press the  Windows key, type **swingez**, and the app appears in the search results as shown below. Click **SwingEZ Launcher** to open it.

Example of the Windows Search screen — see the image we sent you for the actual screen.

STEP 2 Press Rebuild AI Model in Settings → Maintenance

In the launcher, open **Settings** at the bottom left, select the **Maintenance** tab, and press **Rebuild AI Model** under **Repair & storage**.

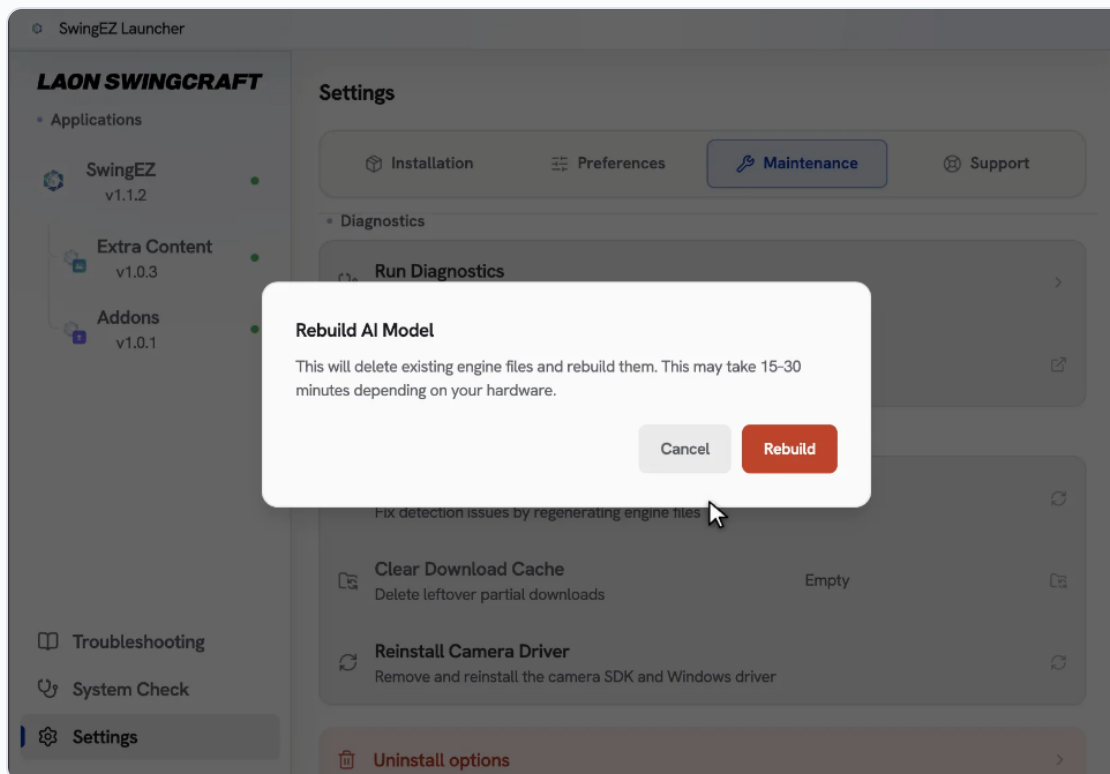

Settings → **Maintenance** tab → **Rebuild AI Model** in the Repair & storage section

STEP 3 Press Rebuild in the confirmation dialog

A confirmation dialog appears, explaining that the existing model files will be deleted and rebuilt. Press **Rebuild**. As the dialog notes, this may take **15–30 minutes** depending

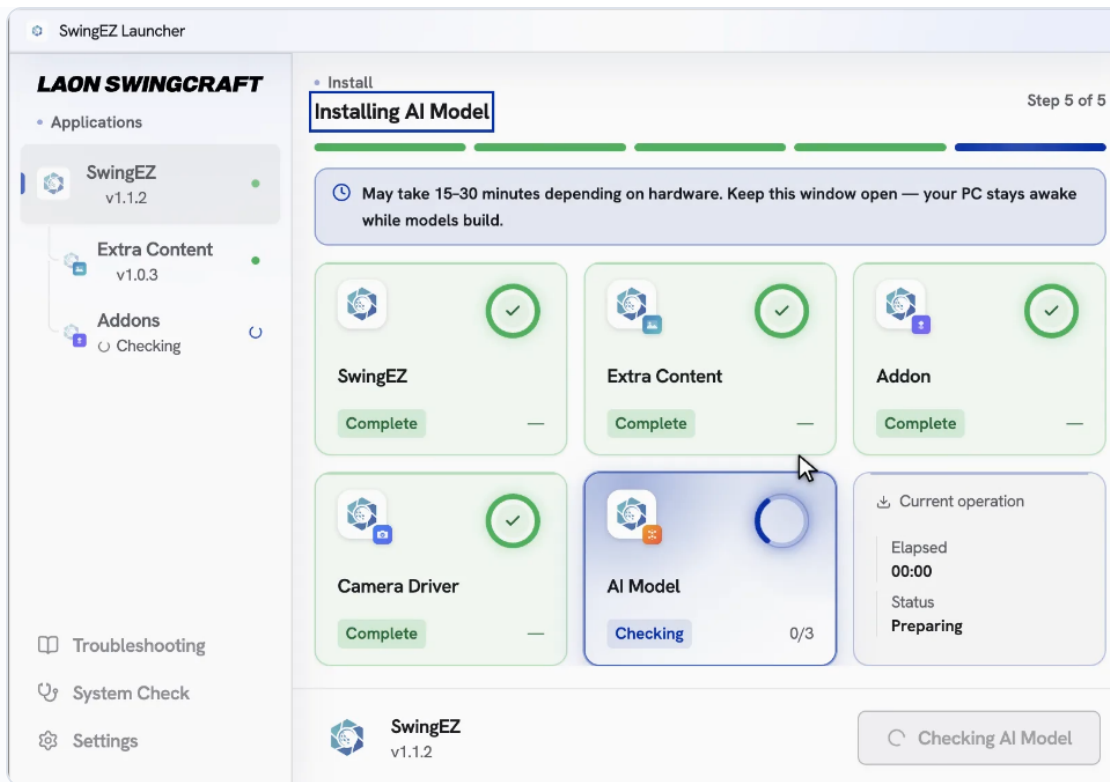

on your hardware.

Press **Rebuild** in the dialog to start.

STEP 4 Wait for the rebuild to finish

The **Installing AI Model** progress screen shown below appears. **Keep the window open** until every item is complete — your PC stays awake while the models build.

The progress screen — you're done when every item, including **AI Model**, shows complete.

While the rebuild is running, do NOT:

- Close the launcher window
- Shut down or restart the PC
- Start the game

STEP 5 When it finishes, start the game as usual

After the rebuild completes, close the launcher and start the game the way you normally do. If your shots are analyzed correctly, you're done.

If analysis still fails after the rebuild, please contact customer support. This procedure is only needed **once each time the graphics card is changed**.
